

Chronic Myeloid Leukemia (CML)

CML develops when the DNA of a developing stem cell in the bone marrow is damaged. CML does not completely interfere with the development of mature red cells, white cells and platelets. CML is generally less severe than acute leukemia.

Typical Age at Diagnosis

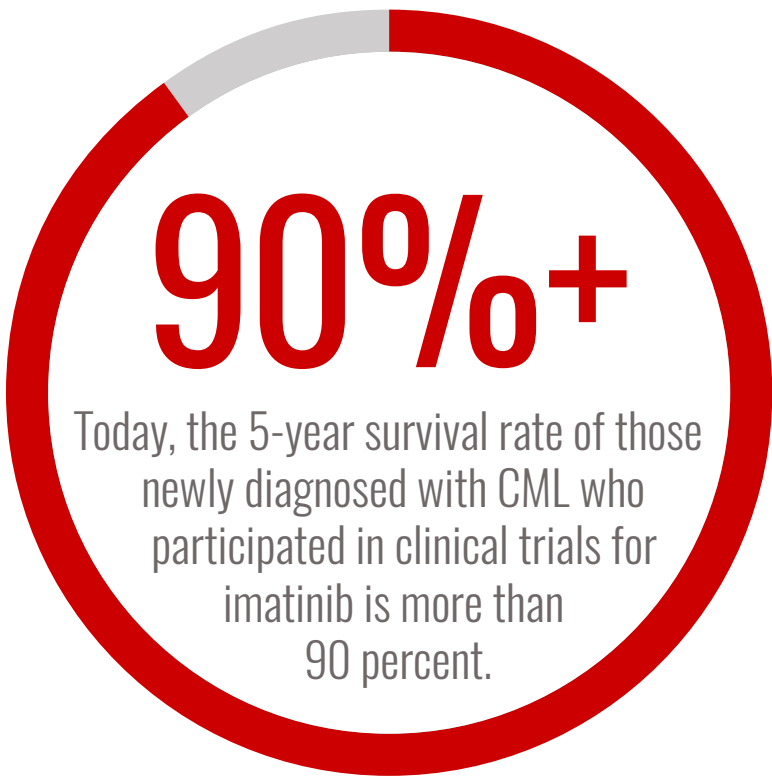

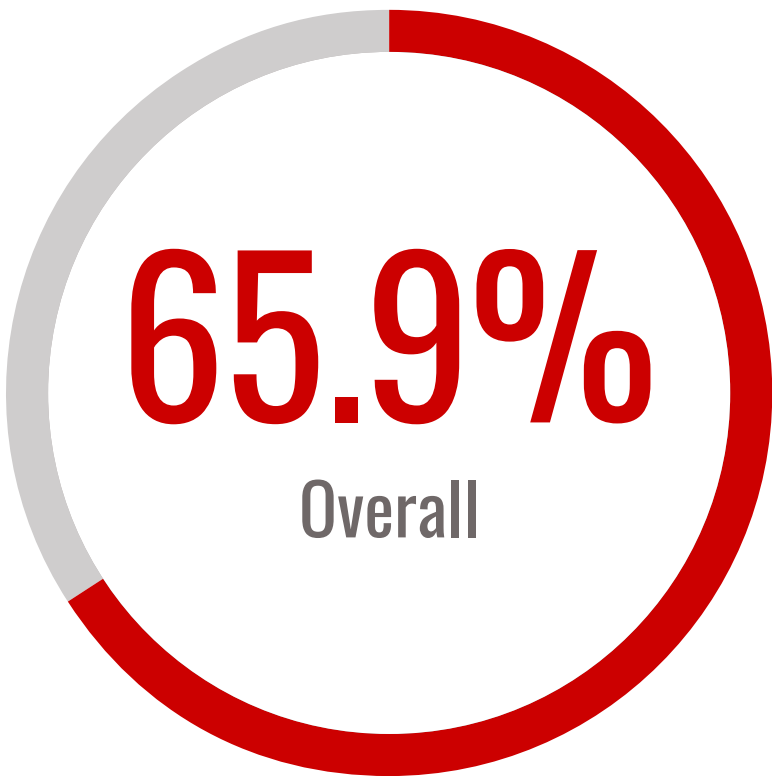

Prevalence / Incidence / Deaths in the US

44,386 people are living with CML.

8,950 new cases are diagnosed each year.

1,080 people die each year.

5 Year Survival Rate

Treatment Options

Tyrosine kinase inhibitors

Ongoing clinical trials

Stem cell transplantation
